 1. Components
 II. Compensatory Mitigation
 III. Special Circumstances

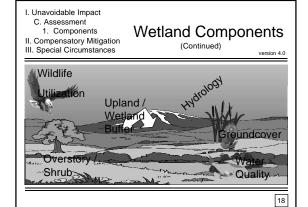

Wetland Components

version 4.0

There are many components to a wetland, which when looked at, can help classify a wetlands health.

These are . . .

	_
I. Unavoidable Impact C. Assessment	
2. Method II. Compensatory Mitigation III. Special Circumstances METHOD version 4.0	
Numeric Functional Assessment	
- Purpose: To determine, in a systematic way, the presence or absence of a given wetland component.	
- Assumption: Wetlands can be measured by assessing a given set of variables.	
19	
	1
I. Unavoidable Impact C. Assessment 2. Method METHOD	
II. Compensatory Mitigation III. Special Circumstances IVIL 11 IOD (Continued) version 4.0	
Many methods of assessing the presence of	
function have been developed, including:	
Habitat Evaluation Procedure (HEP) Wetland Evaluation Technique (WET)	
- Hydrogeomorphic Methodology (HGM)	
- Wetland Rapid Assessment Procedure (WRAP)	
20	
20	
I. Unavoidable Impact	
C. Assessment 2. Method II. Compensatory Mitigation	
III. Special Circumstances (Continued)	
Any numeric assessment method can be used in calculating mitigation, if:	
the method is technically appropriate for the location and type of impact; and,	
the same method is used for both the impact and mitigation sites.	
21

II. Compensatory Willigation	
m. Special Circumstances version 4.0	
- Purpose: To apply value judgement	
to individual functions. For example,	
γ κ wildlife utilization may be more	
important to society than other	
components.	
- Assumption: All functions may not	
be equal importance.	
ME so adda importance.	
Δx Weight	

I. Unavoidable Impact D. Weighting Factor 2. Assigning Weight II. Compensatory Mitigation III. Special Circumstances Assigning Weight version 4.0	
How? - Start with equal weighting. - Change to unequal weighting if specific information warrants. - Develop and apply on watershed basis.	
Prefer to develop weighting as part of interagency team permitting or other watershed efforts.	
Δ x Weight 28	
I. Unavoidable Impact D. Weighting Factor 2. Assigning Weight II. Compensatory Mitigation III. Special Circumstances Assigning Weight (Continued) version 4.0	
Five questions used to assign weight.	
Does project result in identifiable ecological benefits to established watershed issues? (i.e., does an increase or decrease of a function or functions affect an issue listed in a watershed plan or other similar effort?)	
continued	
Δ x Weight [29]	
Unavoidable Impact D. Weighting Forter	
D. Weighting Factor 2. Assigning Weight II. Compensatory Mitigation III. Special Circumstances Assigning Weight (Continued) Version 4.0	
Does project result in identifiable benefits to adjacent lands/waters of regional importance? (e.g., is any function particularly important to regionally important downstream waters?)	
Improves status of Federal and/or State listed threatened, endangered or candidate species?	
continued	
Δ x Weight 30	

I. Unavoidable Impact D. Weighting Factor 2. Assigning Weight II. Compensatory Mitigation III. Special Circumstances Assigning Weight (Continued) version 4.0	
4. Restores or creates ecological features considered to be unusual, unique or rare in region? (e.g., will restoration or impact affect certain habitats/functions that have been largely removed in the past.)	
5. Special Considerations?	<u></u>
Δ x Weight [31]	
I. Unavoidable Impact D. Weighting Factor	
3. Calculation II. Compensatory Mitigation III. Special Circumstances Calculation (Continued) version 4.0	
The sum of the weighting factors will equal 1. Weight1 + Weight2 + Weight3 + Weight4 + Weight5 + Weight6 = 1	
If each of the components are equally important, then each will have 1/6th of the total weight.	
Δ Δ Δ Δ Δ Δ Δ Δ Δ Δ Δ Δ Δ Δ Δ Δ Δ Δ Δ	
Δ1 Δ2 Δ3 Δ4 Δ5 Δ6	
Δ x Weight 32	
I. Unavoidable Impact	
D. Weighting Factor 3. Calculation II. Compensatory Mitigation III. Special Circumstances Calculation (Continued) version 4.0	
Components can be unequally weighted, but the minimum weight for any component is 1/12. $ \begin{tabular}{cccccccccccccccccccccccccccccccccccc$	
x 1/3 x 1/3 x 1/12 X 1/12 x 1/12 x 1/12 	
The single score = $\Delta 1 + \Delta 2 + \Delta 3 + \Delta 4 + \Delta 5 + \Delta 6$	
$= \sum (\Delta \times \text{Weight})$ This defines the second variable of the equation.	
Σ (Δ x Weight) 33	

I. Unavoidable Impact E. Units	
1. Units per Acre II. Compensatory Mitigation III. Special Circumstances Units per Acre version 4.0	
- The use of this equation at this point will result in the calculation of the "Units per Acre"	
These units relate to presence of function	
· ·	
 This represents the change, per acre, of the presence of function resulting from the mitigation or impact activities. 	
	1
I. Unavoidable Impact E. Units	
1. Units per Acre II. Compensatory Mitigation III. Special Circumstances Units per Acre (Continued)	
Here is an example calculation for an impact site.	
Wildlife Overstory Ground Buffer Hydrology Water Utilization Cover Quality Existing Condition 1.5 1.5 2.5 2.5 3.0 2.5 With-project 0 0 0 0 0 0	
Δ divided by 3 1.5/3 1.5/3 2.5/3 2.5/3 3.0/3 2.5/3 X Weight Factor x 1/3 X 1/3 x 1/12 x1/12 x 1/12 x 1/12	
$(\Delta \text{x Weight}) = 1.5/9 1.5/9 2.5/36 2.5/36 3.0/36 2.5/36 \\ \Sigma (\Delta \text{x Weight}) = 22.5/36 = 0.625 \text{Units per Acre}$	
Σ (Δ x Weight) = Units per Acre	
I. Unavoidable Impact E. Units 2. Calculation Units	
2. Calculation UTIIS II. Compensatory Mitigation III. Special Circumstances version 4.0	
Multiplying the Units per Acre by the number of	
acres over which the activity occurs results in the total number of units of "loss" in the presence of	
functions resulting from the proposed impact.	
0.625 units/acre X 10 acres = 6.25 units "loss"	
[$\sum (\Delta \times \text{Weight})$] x Acres = Units 36	

I. Unavoidable Impact	
E. Units 3. Round Off II. Compensatory Mitigation III. Special Circumstances Round Off version 4.0	
0.625 units/acre X 10 acres = 6.25 units "loss"	
We do not know the presence of functions	
down to two decimal places!!	
$[\Sigma (\Delta \times Weight)] \times Acres = Units$ 37	
	1
I. Unavoidable Impact E. Units 3. Round Off II. Compensatory Mitigation III. Special Circumstances Round Off version 4.0	
Retain three decimal places to preserve accuracy as the Δ is multiplied several times within the formula.	
Round the resulting number of units to the nearest integer, except for special circumstances (such as for an exceptionally large or small acreage project)	
0.625 units/acre X 10 acres = 6.25 6 units "loss"	
$[\Sigma (\Delta \times \text{Weight})] \times \text{Acres} = \text{Units}$	
I. Unavoidable Impact	
II. Compensatory Mitigation III. Special Circumstances Version 4.0	
Compensatory mitigation must be designed and implemented to replace these 6 units of loss.	
[Σ (Δ x Weight)] x Acres = Units	

I. Unavoidable Impact II. Compensatory Mitigation III. Special Circumstances	
version 4.0	
II. Compensatory Mitigation	
[Σ (Δ x Weight)] x Acres = Units	
Γ	1
I. Unavoidable Impact II. Compensatory Mitigation Next	
III. Special Circumstances	
There are many ways to provide compensatory	
mitigation.	
One way is to create a replacement	
wetland.	
Now we will calculate the number of units provided by this newly created wetland	
$[\Sigma (\Delta \times Weight)] \times Acres = Units$ 41	
I. Unavoidable Impact]
II. Compensatory Mitigation A. On-Site Creation 1. Assessment On-Site Creation	
III. Special Circumstances version 4.0	
Assessment of On-Site Creation uses	
the same formula but is mathematically the reverse of the impact calculation.	
The existing condition: Creation starts	
with an upland and so the WRAP scores for each component will be 0.	
[$\sum (\Delta \times \text{Weight})$] x Acres = Units 42

I. Unavoidable Impact II. Compensatory Mitigation A. On-Site Creation J. Units (unadjusted) Units (unadjusted)	
3. Units (unadjusted) III. Special Circumstances (Continued) version 4.0	
While an impact activity is relatively	
straightforward,	
There are additional concerns before agreeing to	
the number of units of "lift" just calculated.	
[Σ (Δ x Weight)] x Acres = Units	
Unavoidable Impact II. Compensatory Mitigation	
A. On-Site Creation 4. Concerns III. Special Circumstances Concerns version 4.0	
What are our concerns with on-site creation?	
- Time between impact and full maturity - Some functions mature sooner than others.	
Events outside of control of manager could affect full maturity	
Not every square foot of the created wetland reaches full maturity.	
- Others?	
[$\sum (\Delta \times \text{Weight})$] x Acres = Units 50	
[Σ (Δ x Weight)] x Acres = Units	
	_
I. Unavoidable Impact II. Compensatory Mitigation	
A. On-Site Creation 4. Concerns. III. Special Circumstances Concerns (Continued)	
These concerns are incorporated into the following variables.	
Temp = Temporal Loss Factor = Adjustment for time	
Risk = Risk Factor	
= Adjustment for uncontrollable events	
$ [\Sigma (\Delta \times \text{Weight})] \times \text{Acres} = \text{Units} $ 51	

I. Unavoidable Impact II. Compensatory Mitigation B. Temporal Loss Temporal Loss	
1. Defined III. Special Circumstances version 4.0	
- Purpose: To take into account the time lag between impact and when mitigation	
reaches maturity. - Assumption: There is a time lag between	
when mitigation is completed and when it is fully replaces lost functions or structure.	
[Σ (Δ x Weight)] x Acres = Units	
I. Unavoidable Impact II. Compensatory Mitigation	
B. Temporal Loss 2. Calculation III. Special Circumstances Temporal Loss (Continued) version 4.0	
This graph shows the WRAP score as site matures.	
This would be the graph with 'instant' maturity.	
0% + Years 70 The Temporal Factor is area of the top graph divided by the bottom graph. This is third variable.	
I. Unavoidable Impact	
II. Compensatory Mitigation B. Temporal Loss 3. Comments III. Special Circumstances Temporal Loss (Continued) version 4.0	
- The Temporal Loss Factor allows mitigation that occurs after impact to be counted as compensation.	
- The number of years for a plant community to reach maturity is based on local experience and literature. Also varies depending on climate, planting techniques & etc. Will generally be standardized within a region.	

[Σ (Δ x Weight x Temp)] x Acres = Units

	-
I. Unavoidable Impact II. Compensatory Mitigation B. Temporal Loss 3. Comments III. Special Circumstances Temporal Loss (Continued)	
Temporal Loss Factor is adjusted for "Present Worth" since a Δ "received" in the future is less valuable than if the Δ was "received" today.	
Present Worth (PW) of same sized Δ received in future 1.0 PW 0.0 Year in future in which Δ is provided at mitigation site 70	
The calculation is complicated, but a lookup table is available for day to day use.	
$[\Sigma (\Delta \times \text{Weight} \times \text{Temp})] \times \text{Acres} = \text{Units}$	
	1

C. Risk Risk	
Calculation III. Special Circumstances (Continued) version 4.0	
· Yelsidi 4.0	
These considerations are used to estimate risk.	
- Mitigation type (creation, restoration, preserve)	
- Size of and/or landscape context of the site	
- Maintenance requirements	
- Maintenance plan A draft worksheet is available to "score" these.	
A diait worksheet is available to score these.	
The Risk Factor = 1.0 if the mitigation is expected	
to be 100% successful. This is fourth variable.	
$[\sum (\Delta \times \text{Weight } \times \text{Temp } \times \text{Risk})] \times \text{Acres} = \text{Units}$	

I. Unavoidable Impact	
II. Compensatory Mitigation	
C. Risk Risk 3. Comments	
III. Special Circumstances (Continued)	
- The Risk Factor is related to the Temporal	
Loss Factor as the type of mitigation is varied.	
Temporal Risk	
Creation Long High	
Restoration Short Moderate	
Preservation n.a. Low	
The administrative constraints as without the books	
The administrative constraints on mitigation banks tend to reduce risk to nil (that is, 100% success).	
[Σ(Δx Weight x Temp x Risk)] x Acres = Units 58	
	1
I. Unavoidable Impact	
II. Compensatory Mitigation D. Temp & Risk Temp & Risk	
Calculation	
III. Special Circumstances version 4.0	
Note that Temp and Risk Factors are applied to each	
wetland "account" individually.	
Come watland functions mature earlier than	
Some wetland functions mature earlier than others, e.g., hydrology could be fully established	
sooner than full maturity of the tree saplings.	
 Some types of work is less affected then others by outside influences, e.g., hydrology restored 	
from installing a ditch block has less risk than	
restoration of wildlife habitat adjacent to houses.	
$[\Sigma (\Delta \times \text{Weight } \times \text{Temp } \times \text{Risk})] \times \text{Acres} = \text{Units}$	
L Hogygidahla Impact]
I. Unavoidable Impact II. Compensatory Mitigation	
D. Temp & Risk Units per Acre	
2. Units per Acre	
mi. Special Circumstances version 4.0	
Here are the units per acre for each account that we	
calculated earlier for the example creation site. Now	
we will modify these with sample Temps and Risks	
Wildlife Overstory Ground Buffer Hydrology Water Utilization Cover Quality	
Other cover Quality $(\Delta \times \text{Weight}) = 2.5/9 + 2.5/9 + 2.5/36 + 2.0/36 + 2.0/36$	
X Temp Factor x 0.4137 x 0.3312 x0.9324 x 0.9624 x0.9624 x0.9624	
X Risk Factor x 0.67 x 0.67 x 0.67 x 0.67 x 0.67 x 0.67	-
units per acre = 0.077 0.061 0.047 0.009 0.036 0.036	
$[\Sigma (\Delta \times \text{Weight x Temp x Risk})] = 0.266 \text{ Units per Acre}$	
$[\Sigma (\Delta x \text{ Weight } x \text{ Temp } x \text{ Risk })] = \text{Units per acre}$	

I. Unavoidable Impact II. Compensatory Mitigation D. Temp & Risk Units per Acre	
2. Units per Acre III. Special Circumstances (Continued) version 4.0	
The Temp Factor for three of the accounts is 0.9654.	
 - 0.9654 read from the lookup table for 3 years - 3 years based on estimate when the hydrology, buffer, and water quality functions will mature. 	
The Temp Factor for overstory is 0.3312. - 0.3312 read from the lookup table for 41 years. - 41 years is estimated maturity of saplings.	
[Σ(Δ x Weight x Temp x Risk)] = Units per acre	
	1
I. Unavoidable Impact II. Compensatory Mitigation D. Temp & Risk Units per Acre	
2. Units per Acre III. Special Circumstances (Continued) version 4.0	
The Risk Factors were all high because:	
This example creation site is small The example site will be surrounded by homes	
Natural sheetflow is replaced by drainage system	
A worksheet could be used to mathematically score	
the risk or could use experience from other sites.	
[Σ (Δ x Weight x Temp x Risk)] = Units per acre	
I. Unavoidable Impact II. Compensatory Mitigation D. Temp & Risk Units	
3. Units III. Special Circumstances version 4.0	
Multiplying the Units per Acre by the number of	
acres that will be created will provide the number of units of "lift". This is the increase in the presence	
of functions resulting from the creation of the wetland.	
0.266 units/acre X 20 acres = 5.32 5 units "lift"	
Now we will compare this to impact site	
[Σ (Δ x Weight x Temp x Risk)] x Acres = Units 63	

I. Unavoidable Impact II. Compensatory Mitigation E. Project Total 1. Compare III. Special Circumstances	
For the impact site: 0.625 units/acre X 10 acres = 6.25 6 units "loss"	
For the creation site: 0.266 units/acre X 20 acres = 5.32 5 units "lift"	
The proposed project will result in a net change in the presence of functions:	
Net = (6 units "loss") - (5 units "lift") = 1 unit "loss"	-
[Σ (Δ x Weight x Temp x Risk)] x Acres = Units	
I. Unavoidable Impact	
II. Compensatory Mitigation E. Project Total 2. Adjust III. Special Circumstances Project Total (Continued) version 4.0	
Impact: 0.625 units/acreX10 acres=6.25 6 units "loss" Created: 0.266 units/acreX20 acres=5.32 5 units "lift" Net = (6 units "loss") - (5 units "lift") = 1 unit "loss"	
If the quantity of lift equals the loss, then the project is assumed to provide sufficient compensatory mitigation, subject to common sense (for example, creation of mangrove does not compensate for impacts to cypress).	
[Σ (Δ x Weight x Temp x Risk)] x Acres = Units 65	
I. Unavoidable Impact	
II. Compensatory Mitigation E. Project Total 2. Adjust III. Special Circumstances Project Total (Continued) version 4.0	
Impact: 0.625 units/acreX10 acres=6.25 6 units "loss" Created: 0.266 units/acreX20 acres=5.32 5 units "lift" Net = (6 units "loss") - (5 units "lift") = 1 unit "loss"	
Options to bring the Net to zero: - Adjust number of acres - Change management of work to reduce risk or other variable - Add another mitigation location	
[Σ (Δ x Weight x Temp x Risk)] x Acres = Units 66	

I. Unavoidable Impact

[$\sum (\Delta x \text{ Weight x Temp x Risk})$] x Acres = Units

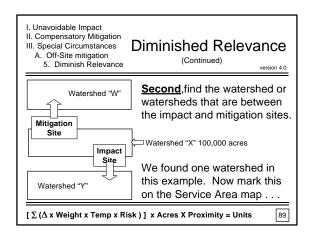

I. Unavoidable Impact II. Compensatory Mitigation III. Special Circumstances	
version 4.0	
III. Special Circumstances	
iii. Special Circumstances	
[Σ (Δ x Weight x Temp x Risk)] x Acres = Units	
	1
Unavoidable Impact II. Compensatory Mitigation III. Special Circumstances	
version 4.0	
The special circumstances are:	
- Off-site mitigation (proximity factor)	
- Secondary Impact (and Large Preserves)	
- Preservation	
[Σ (Δ x Weight x Temp x Risk)] x Acres = Units [77]	
I. Unavoidable Impact II. Compensatory Mitigation	
III. Special Circumstances A. Off-Site Mitigation 1. introduction Off-Site Mitigation version 4.0	
What if the mitigation is off-site?	
- Off-site location that is contiguous with	
other natural areas is more appropriate than on-site "postage stamp"	
- This may better address watershed	
issues	
[Σ (Δ x Weight x Temp x Risk)] x Acres = Units 78	

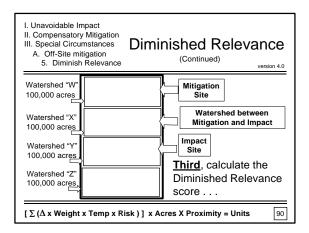

I. Unavoidable Impact	
II. Compensatory Mitigation III. Special Circumstances A. Off-Site mitigation 2. Concerns version 4.0	
What are our concerns with off-site mitigation?	
- Wildlife different? - Different receiving water bodies (especially for water quality function)? - If impact is large % of small watershed, will it be fully compensated by mitigation in another watershed?	
- Others?	
$[\Sigma (\Delta x \text{ Weight } x \text{ Temp } x \text{ Risk })] \times \text{Acres} = \text{Units}$	
	1
I. Unavoidable Impact II. Compensatory Mitigation III. Special Circumstances A. Off-Site mitigation 2. Concerns Concerns (Continued) version 4.0	
These concerns are incorporated into the Proximity Factor variable.	
I. Unavoidable Impact II. Compensatory Mitigation III. Special Circumstances A. Off-Site mitigation 3. Proximity Factor	
- Purpose: To take into account distance	
between the impact and mitigation sites. - Assumption: Mitigation in the same watershed as the impact is optimal.	

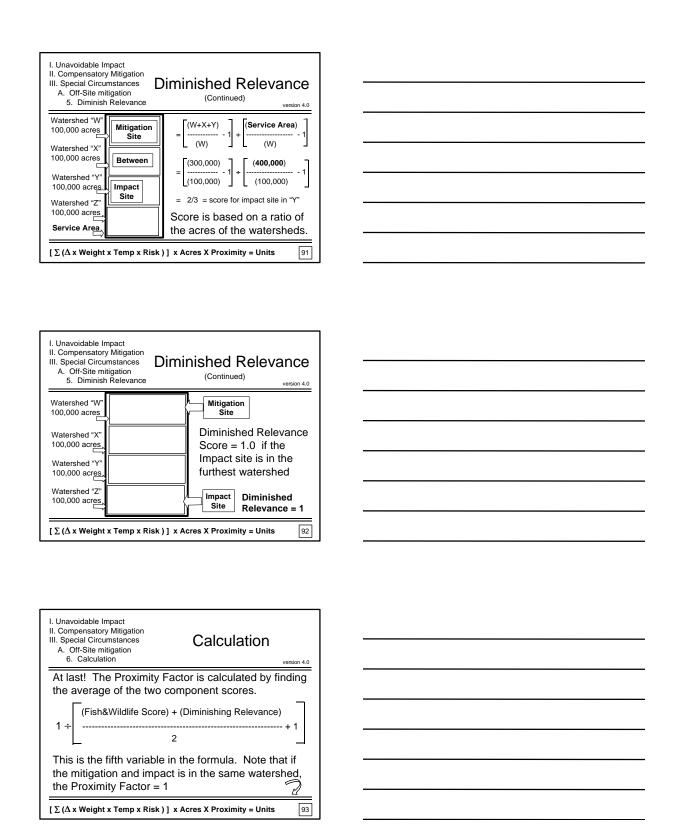

I. Unavoidable Impact II. Compensatory Mitigation III. Special Circumstances Proximity Factor	
III. Special Circumstances A. Off-Site mitigation 3. Proximity Factor (Continued) version 4.0	
This factor has two components.	
- Fish and Wildlife (based on number of guilds at sites)	
- Diminishing Relevance (based on watersheds)	
	_
I. Unavoidable Impact II. Compensatory Mitigation III. Special Circumstances A. Off-Site mitigation 4. Fish & Wildlife version 4.0	
The Fish & Wildlife component is based on two questions.	
Question A: Is the guild represented at the impact site? Answer either yes or no for each guild. Neotropical Migrants Reptiles Wading Birds Freshwater Fish Raptors Small Mammals Waterfowl Large Mammals Amphibians Invertebrates	
$ [\Sigma(\Delta \times \text{Weight} \times \text{Temp} \times \text{Risk})] \times \text{Acres X Proximity} = \text{Units} $	
I. Unavoidable Impact II. Compensatory Mitigation	
III. Special Circumstances A. Off-Site mitigation 4. Fish & Wildlife (Continued) version 4.0	
Question B: Does location of the mitigation relative to impact reduce the ability to mitigate that guild? A B A B	
Neotropicals no Reptiles yes no Wading Birds yes yes Freshwater Fish yes no	
Raptors no Small Mammals yes yes Waterfowl yes no Large Mammals no Amphibians yes no Invertebrates yes no	
Fish & Wildlife Score = B yes's ÷ A yes's = 2 / 7	
[Σ (Δ x Weight x Temp x Risk)] x Acres X Proximity = Units	

I. Unavoidable Impact
II. Compensatory Mitigation
III. Special Circumstances
 B. Secondary Impact
1. introduction

Secondary Impact

Wetlands can be impacted even if fill is not placed directly on them.

Wetlands are affected by activities adjacent to it.

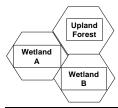

[\sum (Δ x Weight x Temp x Risk)] x Acres X Proximity = Units

94

I. Unavoidable Impact
II. Compensatory Mitigation III. Special Circumstances B. Secondary Impact 2. Illustration

Secondary Impact (Continued)

We will assess the impact on Wetland A.

Existing Condition. The wetland has surrounding natural vegetation. It receives clean runoff, is connected to a larger area of habitat, and is buffered from other uses.

[$\sum (\Delta x \text{ Weight x Temp x Risk})$] x Acres X Proximity = Units

95

I. Unavoidable Impact
II. Compensatory Mitigation III. Special Circumstances B. Secondary Impact 2. Illustration

Secondary Impact

(Continued)

We then build houses but preserve Wetland A.

With Project Condition. The wetland is now smaller and is impacted by the houses. The numeric functional assessment will be lower than the existing but not

[$\sum (\Delta x \text{ Weight x Temp x Risk})$] x Acres X Proximity = Units

III. Special C B. Secon	tory Mitigation frcumstances dary Impact parison	Types of Ac	ctivities
